

Psychomotor Vigilance Test (PVT) summary

The PVT was initiated on September 1995 as a behavior (vigilance) outcome measure in the Wisconsin Sleep Cohort Study. It was incorporated into the daytime sleep study protocol with the test given at 10am and 1pm. The task takes 10 minutes to perform.

All daytime study participants were asked to perform the test. Since the inception of the Narcolepsy study, those participants who were in the Narcolepsy study did not perform the PVT (approximately 2/2002).

In this section, you'll find:

- Instrument information
- PVT administration—instructions to test administrator
- Data download, retrieval, and output using the proprietary software, PVTCOMM and PVT REACT. - See Hyon Kim for the software
- Initial data analysis - See Hyon Kim
